What are Dynamic Components?

Create Components at runtime

Dynamic components

- Dynamic Components: create and render components at runtime.
- refer to a container using a template variable
- inject newly created components into it as a result of some user interaction.
- Angular 13+: as simply as that
  - previous versions:
    more boilerplate code needed
- Not much slides, mostly code, demo:

Workshop

1. Work from `../780-dynamic-components`
2. Get the example code up and running
3. Study how the code works
4. Create a new ‘Accordion’ container, add some content
   - CSS for a ‘real’ accordion is not important right now.
   - Make sure you can hide/show some panes in the accordion
